

PHILIPS

Model 681A

General Description : Nine-valve (including rectifier), four-waveband superheterodyne receiver with special facilities for bandspread tuning on eight S.W. broadcast bands. The circuit possesses a number of features not normally encountered in broadcast receivers, and can best be considered as : (a) a four-waveband superheterodyne receiver, with an R.F. amplifying stage and a push-pull output stage; and (b) a double-conversion superheterodyne bandspread receiver.

Power Supply : A.C. mains, 100-250 volts, 50-100 c/s.

Wavebands : (a) S.W.2 11.1-34.2 m.; S.W.3 34.2-110.5 m.; M.W. 192-560 m.; L.W. 900-2000 m.; (b) Bandspread 11, 13, 16, 19, 25, 31, 41, 49 m. Each band covers 0.5 Mc/s.

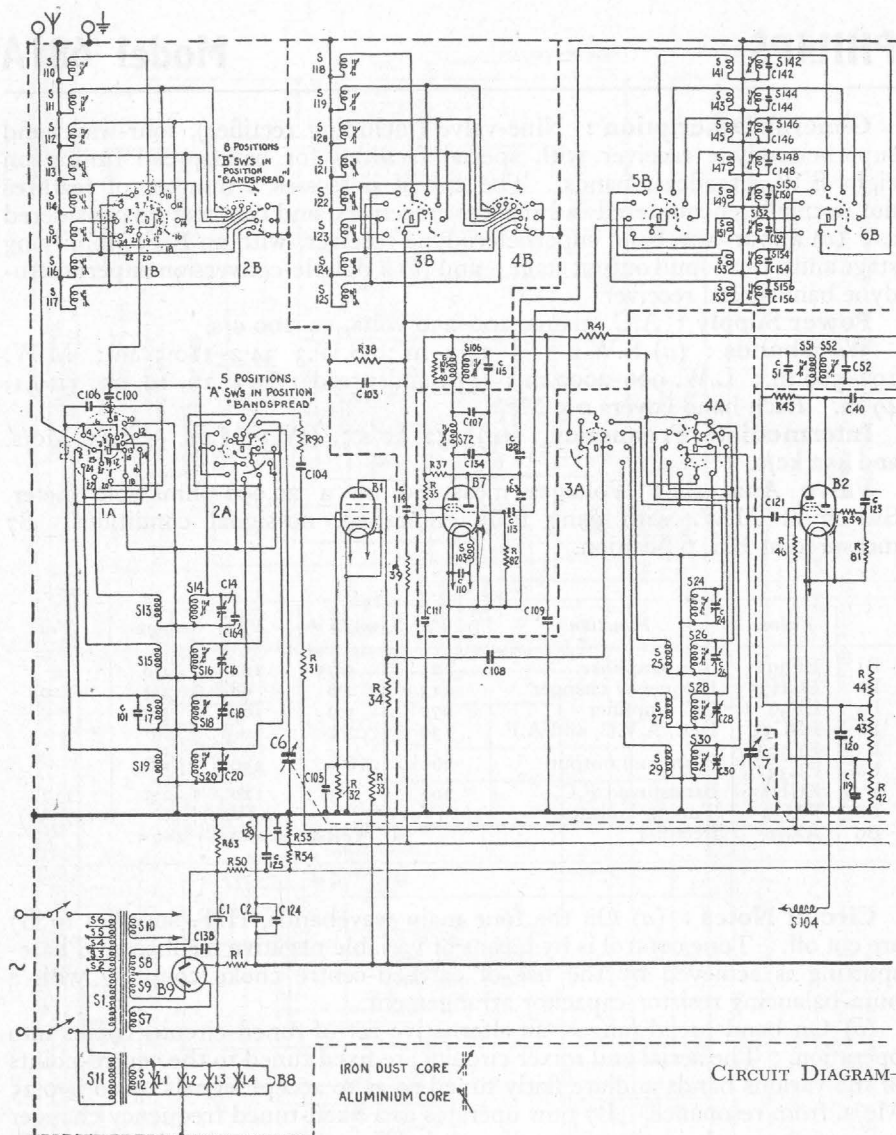

Intermediate Frequency : (a) 452 kc/s.; (b) 3 Mc/s. \pm 0.25 Mc/s. and 452 kc/s.

Valve Analysis : Voltages measured on a 20,000-ohms/volt meter. Switch at M.W. with gang fully enmeshed, no-signal conditions. B7 measured at B.S. 6 position.

	Valves	Function	Va	Ia	Vg2	Ig2	Vat
B1	EF39	R.F. amplifier	125	5.75	102	1.8	—
B2	ECH35	Frequency changer	213	2.6	98	2.4	110
B3	EF39	I.F. amplifier	270	5.9	105	1.75	—
B4	EB33	Det., A.V.C. and A.F.	130	2.2	—	—	—
B5	EL33	Push-pull output	260	16	230	1.8	—
B6	EL33						
B7	ECH35	Bandspread F.C.	202	2.3	110	2.3	117
B8	EM34	Tuning indicator	202 (Var)	—	110 (Vaz)	—	117 (Vt)
B9	AZ31	Rectifier			Voltage across C1 280 v.		

Circuit Notes : (a) On the four main wavebands, H.T. supplies to B7 are cut off. Tone control is by means of variable negative feedback. Phase-splitting is achieved by the use of earthed-centre choke coupling with a hum-balancing resistor-capacitor arrangement.

(b) On bandspread ranges, an alternative set of tuned circuits comes into operation. The aerial and mixer circuits are fixed tuned to the centre-points of the various bands and are flatly tuned so as to accept signals up to \pm 0.25 Mc/s. from resonance. B7 now operates as a fixed-tuned frequency changer converting signals in the centre of each band to 3 Mc/s., signals at the L.F. end to 3.25 Mc/s. and signals at the H.F. end to 2.75 Mc/s. The converted signals between 2.75 and 3.25 Mc/s. appear across the fixed-tuned grid circuit of B2, which acts as a second frequency changer by means of a fifth oscillator tuned circuit with a range of approximately 2.30-2.80 Mc/s. The remaining stages of the receiver function in the same manner as for (a). On bandspread ranges only one section (osc. section) of the triple-ganged tuning capacitor is used.
